December 1999

Selected Demographic and Public Health Measures Rankings for Texas Counties 1995-1997

This report provides county rankings of selected public health data for the combined years 1995 through 1997. Counties are ranked from highest to lowest value, with identical values given the same rank. Counties with fewer than 20 numerator events in the three year period (1995 through 1997) for any given category are not ranked. These counties are listed as not ranked (NR) in alphabetical order following counties with ranked values. The user of this report should view rates and values for unranked counties with considerable caution since those values are less stable and more likely to randomly fluctuate through time.

The actual measured values for each county are included on the corresponding map when available, regardless if they were ranked or not. Map data are presented in quartile format, dividing the entire range of continuous data into four discrete categories. Measures for this report were selected to cover a wide range of important indicators: natality, mortality and morbidity. Brief sources of data are noted for each measure on the page that the statistic is reported. The tables in the appendix of this report provide county rankings by demographic, natality, mortality, and morbidity characteristics alphabetically by county. A glossary is included in the last section along with a more detailed listing of data sources.

This report was prepared by:

**Texas Department of Health
